

TOPIC: TECHNICAL SOLUTIONS TO INCREASE EFFICIENCY

QUESTION: How does this technology help increase efficiency?

“Virtualization technology helps increase efficiency by being able to manage multiple servers easily, you can do it remotely with only one physical piece of hardware to work on. I can restart the machines, I can power ‘em down, power ‘em up; everything that I would be able to do to a machine if I was physically there, I can do remotely. It helps me be more efficient being able to easily backup, restore. I can keep a pristine copy of an operating system that I might use a lot. I copy that and I can install my software. I don’t have to go through the whole process of installing the operating system because that takes time. I don’t have to do that because I already have a copy of it virtually So, I can easily do this with minimal down time with virtualization.”
